

CASE STUDY

About

The University of Florida Transportation Institute (UFTI) located in the Herbert Wertheim College of Engineering aims to advance state-of-the-art transportation, disseminate research results, and provide educational opportunities related to transportation. UFTI brings together faculty, staff, and students from many diverse backgrounds to provide solutions to a variety of transportation problems.

Objective

Compare human mobility patterns in the area of the Kincade, California wildfires - before, during, and after the disaster.

Gravy Solution:

UFTI researchers turned to Gravy for human mobility data for their analysis.

- **Gravy Observations DaaS | Using Forensic Flags** – Capture human movement in and out of designated evacuation zones around the Kincade Fire and the associated timing of those movements

Key Insights:

Gravy's data help to reveal that:

- **54% of residents did not evacuate** during the wildfire
- **38% of residents inside of the evacuation order zone only left home once they received mandatory orders**

Results

Gravy's data and the resulting analysis help emergency managers to:

Better understand how people behave during wildfire evacuations

Improve emergency management policies based on the regular behaviors of local populations

Reduce the impact of wildfires with public outreach campaigns and emergency communication plans for at-risk populations
